SentinelLab QA & Improvement Report

Findings observed during synthetic SOC case SL-IR-2026-001 | 14 October 2026

Purpose and release discipline

This report consolidates application behaviors observed during the investigation and proposes post-investigation improvements. It is a QA backlog, not a claim that code changes were implemented. Preserve the investigation records, evidence attachments, and existing working functionality. Keep draft PR #3 unmerged pending a dedicated regression and release review.

Verified working behaviors

Area	Observed behavior
CSV export	Windows Save As dialog opens promptly
JSON export	Save As dialog opens after roughly 3 seconds; defer optimization
Chatbot launcher	Collapse/expand arrow works
Evidence attachment	JSON and CSV accepted; SHA-256 prefixes shown
Investigation notes	New notes persist
Event details	Overview, Raw Data, Normalized and Related tabs visible
Threat Intelligence	Active IOC and 64 indicator hits shown

Priority defects and enhancements

ID / priority	Observation	Acceptance criteria
BUG-004 / High	Cramped modal and Findings text area	Resizable/maximizable dialogs, expandable editor, responsive layout, no text loss
BUG-005 / Medium	Notes flatten line breaks and show raw Markdown	Preserve paragraphs and render supported formatting safely
BUG-006 / High	AI explanation shows raw Markdown	Readable sanitized Markdown display
BUG-007 / Medium	Events Explorer hides destination IP in list	Destination IP/ports shown or accessible; explain search matches
BUG-008 / High	Related alert/event entries are not clickable	Open related details and navigate back without losing context
BUG-009 / High	Findings autosaves without Save/Cancel/Clear controls	Explicit save/cancel, confirmed clear, autosave status, undo and revision history

ID / priority	Observation	Acceptance criteria
BUG-010 / High	Tasks are static after creation	Persistent complete/reopen/edit/delete, confirmation, audit, progress and ownership
TI-001 / High	IOC provenance not sufficiently exposed	Indicator detail shows source, rationale, confidence, dates and validation
QA-011 / Medium	IOC alert reports 64 events but shows 50 supporting rows	Clearly label pagination/truncation and provide access to all matches
QA-012 / Medium	Alert host/user summary can obscure multi-host scope	Show affected host set and distinguish representative vs aggregated fields

AI investigation improvements

ID	Requirement
AI-001 / AI-006	Separate observed facts, hypotheses, and recommendations with uncertainty labels
AI-002 / AI-007	Provide relevant surrounding events, including subsequent successful logins and proxy activity
AI-003	Cite event IDs and rule/IOC records for each factual conclusion
AI-004	Explain the selected alert, not only nearby unrelated telemetry
AI-005	Show exact IOC field, source and confidence rationale
AI-008	Avoid automatic disruptive-action advice without operational context

Suggested implementation order

• Sprint A — Data safety: BUG-009 explicit save/recovery and BUG-010 real task lifecycle, with migration safeguards.

• Sprint B — Analyst navigation and readability: BUG-004, BUG-005, BUG-006, BUG-007 and BUG-008.

• Sprint C — Detection transparency: TI-001, QA-011, QA-012, and evidence detail/custody visibility.

• Sprint D — Grounded AI explanations and contextual correlation, with regression fixtures from the synthetic case.

Regression test checklist

• Existing Findings and all five case tasks survive schema migrations; no data loss.

• Save, cancel, clear confirmation, autosave and version restore behave consistently across close/reopen.

• Task completion/edit/deletion persists and produces accurate audit entries.

• Related alert and event navigation resolves the correct IDs and preserves modal history.

• Full IOC match list remains accessible; any 50-row display cap is explicitly disclosed.

• Both JSON and CSV exports remain valid, filtered correctly, and use native Windows Save As.

• AI response correctly separates 12 failed logins, one successful login and two proxy connections without asserting compromise.

Known limitations

Findings reflect screenshots and manual user testing, not a complete source-code audit. Feature design proposals are not evidence of existing backend support. The JSON Save As delay is deliberately deferred. No merge or release is authorized by this report.
